Awareness of Educational Research

Educational research as a discipline is not as old as other disciplines. Pestalozzi began his research work in the year 1803 and proposed the scientific study of pedagogy. After the First World War (1914-1918) development of Intelligence tests and aptitude test took place. In India, after 1945 a few developments took place. In India, after 1945 a few developments took place with regard to educational research. More universities were started with courses like M.Ed, Ph.D: education related journals like Journal of Higher Education were started. The University Grant Commission mandated the guidelines for PhD and M.Phil courses from time to time. A notification was issued by the UGC (2018) to use plagiarism software and reduce the activity of copy and paste.

Meaning of Educational Research

The term Education means to (to nurture, care and bring forth) facilitate or arrange for school plant; organize physical

and teaching resources, plan for everyday activities, quality evaluation, cultural, economical aspects of running of educational institutions. Education means not just school education; it includes pre-primary education; primary education; secondary education; higher education; agricultural education and technical education and non-formal education. So, the study about all these aspects individually or as a group-is known as educational research. Study includes following a proper scientific method; well defined objectives; methodology; analysis of data and recording of findings.

Definition: According to JW Bost “Educational research is that activity which is directed towards development of a science of behavior in educational situations. The ultimate aim of such a science is to provide knowledge that will permit the educator to achieve his goals by the most effective methods”.

Purpose of Educational Research

“Everyone has the right to education. Education shall be free at least in the elementary and fundamental stages, Elementary education shall be compulsory. Technical and professional education shall be made generally available and higher education shall be equally accessible to all on the basis of merit. “Universal Declaration of Human Rights,” Article 26 (1)

Study of Variable in Education

Educational researchers have to identify variables. A Serious effort has to be made to identify variables. A variable means of thing, place or a phenomenon that the researcher is trying to fix.

Independent Variable

In the teaching –learning process or in teacher education pedagogy means different methods. It is controlled variable in a study. A method is a condition or a characteristic of a method which is measurable; the researcher controls this variable or changes this variable to see the effect of other variables. Method is an independent variable; the students’ attendance is a dependent variable. A method works within its limits to effect other variables i.e, dependent variables- e.g. age, uniforms, dress code policy, guiding principles, draft rules. In a research, the researcher finds regularly a few factors like height, weight, ethnicity,

medical history, substance exposure all these are termed as independent variables.

Dependant Variable

This variable has no limit to its functioning and always depends upon other factor to perform. The students' achievement score always depends upon teaching in the classroom; certain factors do not remain the same. They change like to score in math's does not remain the same. The other examples are like students' self-esteem, academic achievement, school safety, positive school climate etc.

Confounding Variable:

It is a factor or a characteristic that influences both the dependent and independent variable and is known as the confounding variable. (Wikipedia) It must be correlated to the independent variable and casually related to the dependent variable.

These are of two types:

1. Intervening Variable.
2. Extraneous variable.

The study of confounding variable is a must; to fulfill the internal validity the researcher must account for confounding variables. If this is ignored it may not

reflect the actual relationship between variables he or she is interested in. For instance, you may find a caused by the measure confounding variable (and not by your independent variable).

Qualitative Research:

Qualitative research is a process of naturalistic inquiry of understanding of social phenomena within their natural setting. It focuses on the "why" rather than the "what" of social phenomena and relies on the direct experiences of human beings as meaning – making agent in their everydaylives. Data is collected on basis of categories. Qualitative researchers are allowed to transcribe the data, use multiple systems of inquiry for the study of human phenomena including biography, case study, historical, analysis, discourse analysis, ethnography, grounded theory, etc phenomenology, (UTA libraries).

How to avoid the Plagiarism:

In –text citing is allowed: take the help of paraphrasing and give citation; use double quotations and use them; use short sentences. Ask for permission from copyright –holders; videos, images, photos and copyright.
